Introducing Panoptes MultiSize Object Detection

Enabling Panoptes users to customize the object minimum size, depending on the depth of their camera Field of View, new MultiSize allows detecting intruders far away while still eliminating false detections.

Most video analytics products allows the specification of a minimum object size to filter out small false objects that maybe detected due to background noise, reflections, or even small animals. While helping with these noisy elements, a fixed size minimum object filter can also eliminate legitimate objects such as people in the far field when the camera view has a significant field depth.

Panoptes' new MultiSize feature uses the camera Field of View to adjust the minimum object sizes along the scene as shown in the camera views below to allow detecting all objects whether they are near or far and still eliminating noisy objects.
