

intuVision to Participate in Internet of Things World Forum

Use of IP cameras to collect security and business information has become ubiquitous over the last decade, generating hundreds of thousands of hours of video. The volume of video generated has been unmanageable, examined in detail only during an event occurrence.

Bringing these cameras into the Internet of Things (IoT), and automating the process of obtaining actionable information from video feeds, is accomplished through video analytics. These automated systems can provide information as diverse as parking spot availability, traffic patterns or wait durations, crowd levels, etc.

Bringing disparate smart sensors, including video cameras, together to increase usefulness of real-time data from various sources to create smart and connected cities has been the focus at Cisco's inaugural IoT World Forum, held in Barcelona, Spain. intuVision was invited to the IP camera panel, recognizing our role in advancing video analytics capabilities.
