

intuVision Unveils Version 5.1 of Panoptes

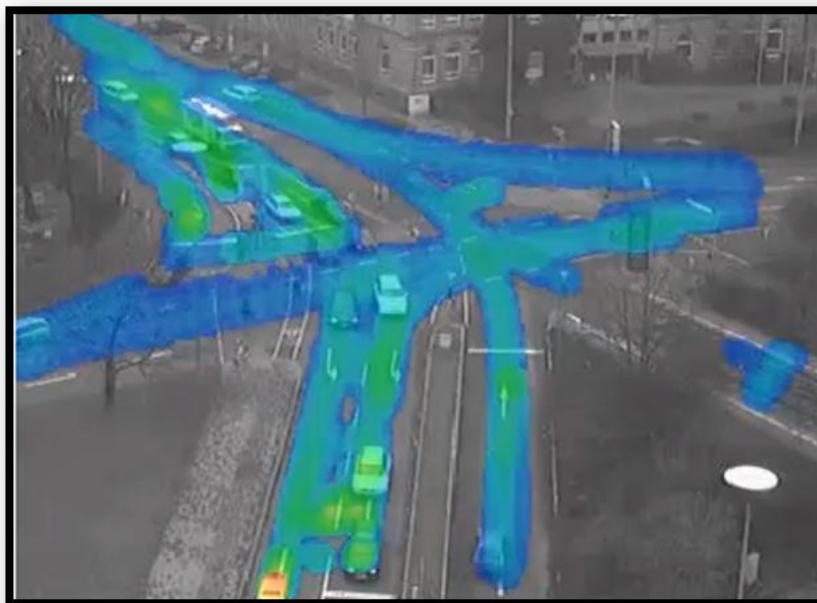

Introduced in version 5.1, Panoptes provides the capability to store object tracks. Using this information, several review options are provided to users, including heatmaps, searchable tracks, and feature rich archive video.

Other new features include:

- Added heatmap capabilities for easy video scene summary,
- Improved video archive playback with overlaid bounding boxes,
- Added PTZ functionality for exacqVision ingested cameras,
- Improved Cisco VSM event linking to send event metadata to Cisco VSM,
- Improved product usability.

Using **heatmaps**, users can see the accumulated travel information over a selected period of time. As more objects travel on a path or pause for various durations, the heatmap reflects these actions. Used, as here, in a traffic scenario, users can tell at a glance where the bottlenecks are and can change the traffic light patterns accordingly. Similarly, in a retail environment, users can tell at a glance which sale items attract the shoppers' attention and which paths are most commonly travelled.

Searchable tracks collect motion information and snapshots of every object detected, even those not associated directly with an event. This allows you to go back after an unforeseen occurrence and look for video clues. Users simply enter time and camera information, and they can quickly scan through objects and snapshots for those offering relevant information.
